# Overview

- What we want to get out of 3D data visualization
- Types of visualizations when rendering 3D graphics
- How we can leverage *Blender* for 3D viz
- Examples

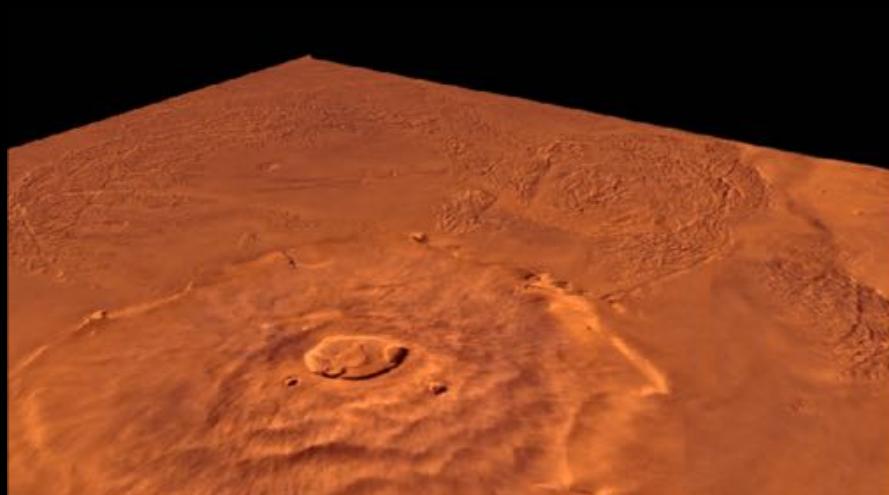

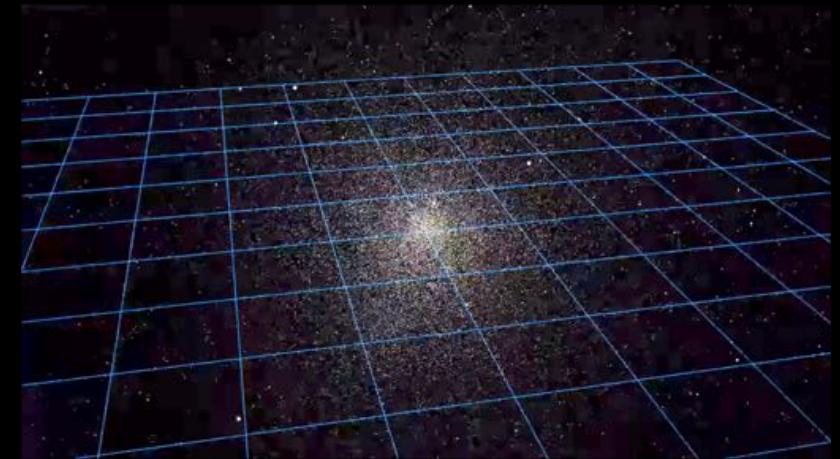

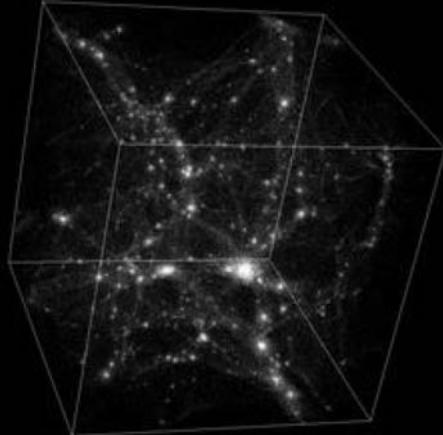

# Astrophysical Phenomena

# What do we want when visualizing our data in 3D?

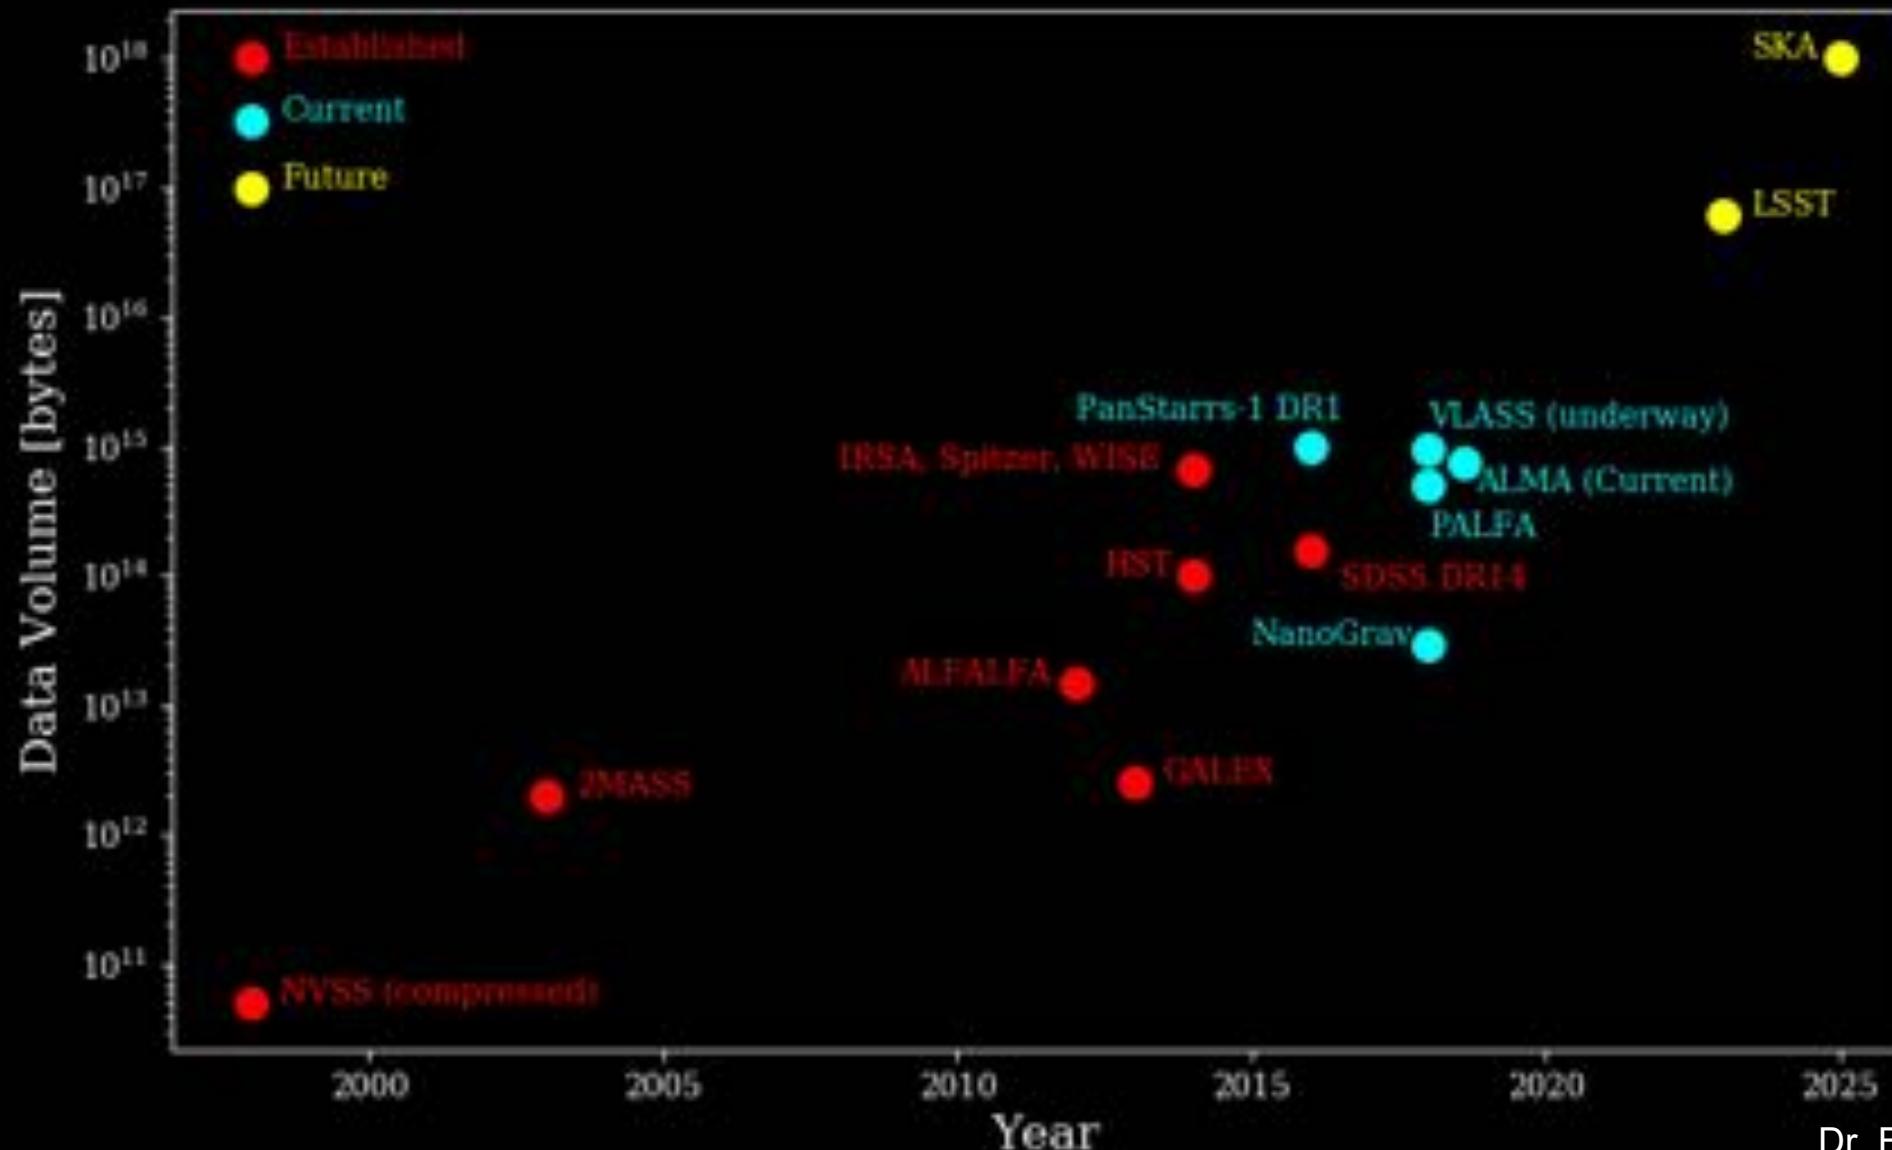

- Effectively display a discovery, principle, data characteristics, or parameter space
- Show a data perspective not otherwise seen
- Collapse a high N phase space into a 3D animation
- Visuals for EPO

# 3D Graphics, Python, and Astronomy

I use a non-traditional package called Blender to render different forms of astronomical data - catalogs, data cubes, simulations, etc.

# What is Blender?

Blender is:

- 3D graphics software for modeling, animation, and visualization
- Open-source
- a real-time 3D viewer and GUI
- A Python scriptable interface for loading and manipulating data

<http://www.blender.org>

# Elements of 3D Graphics

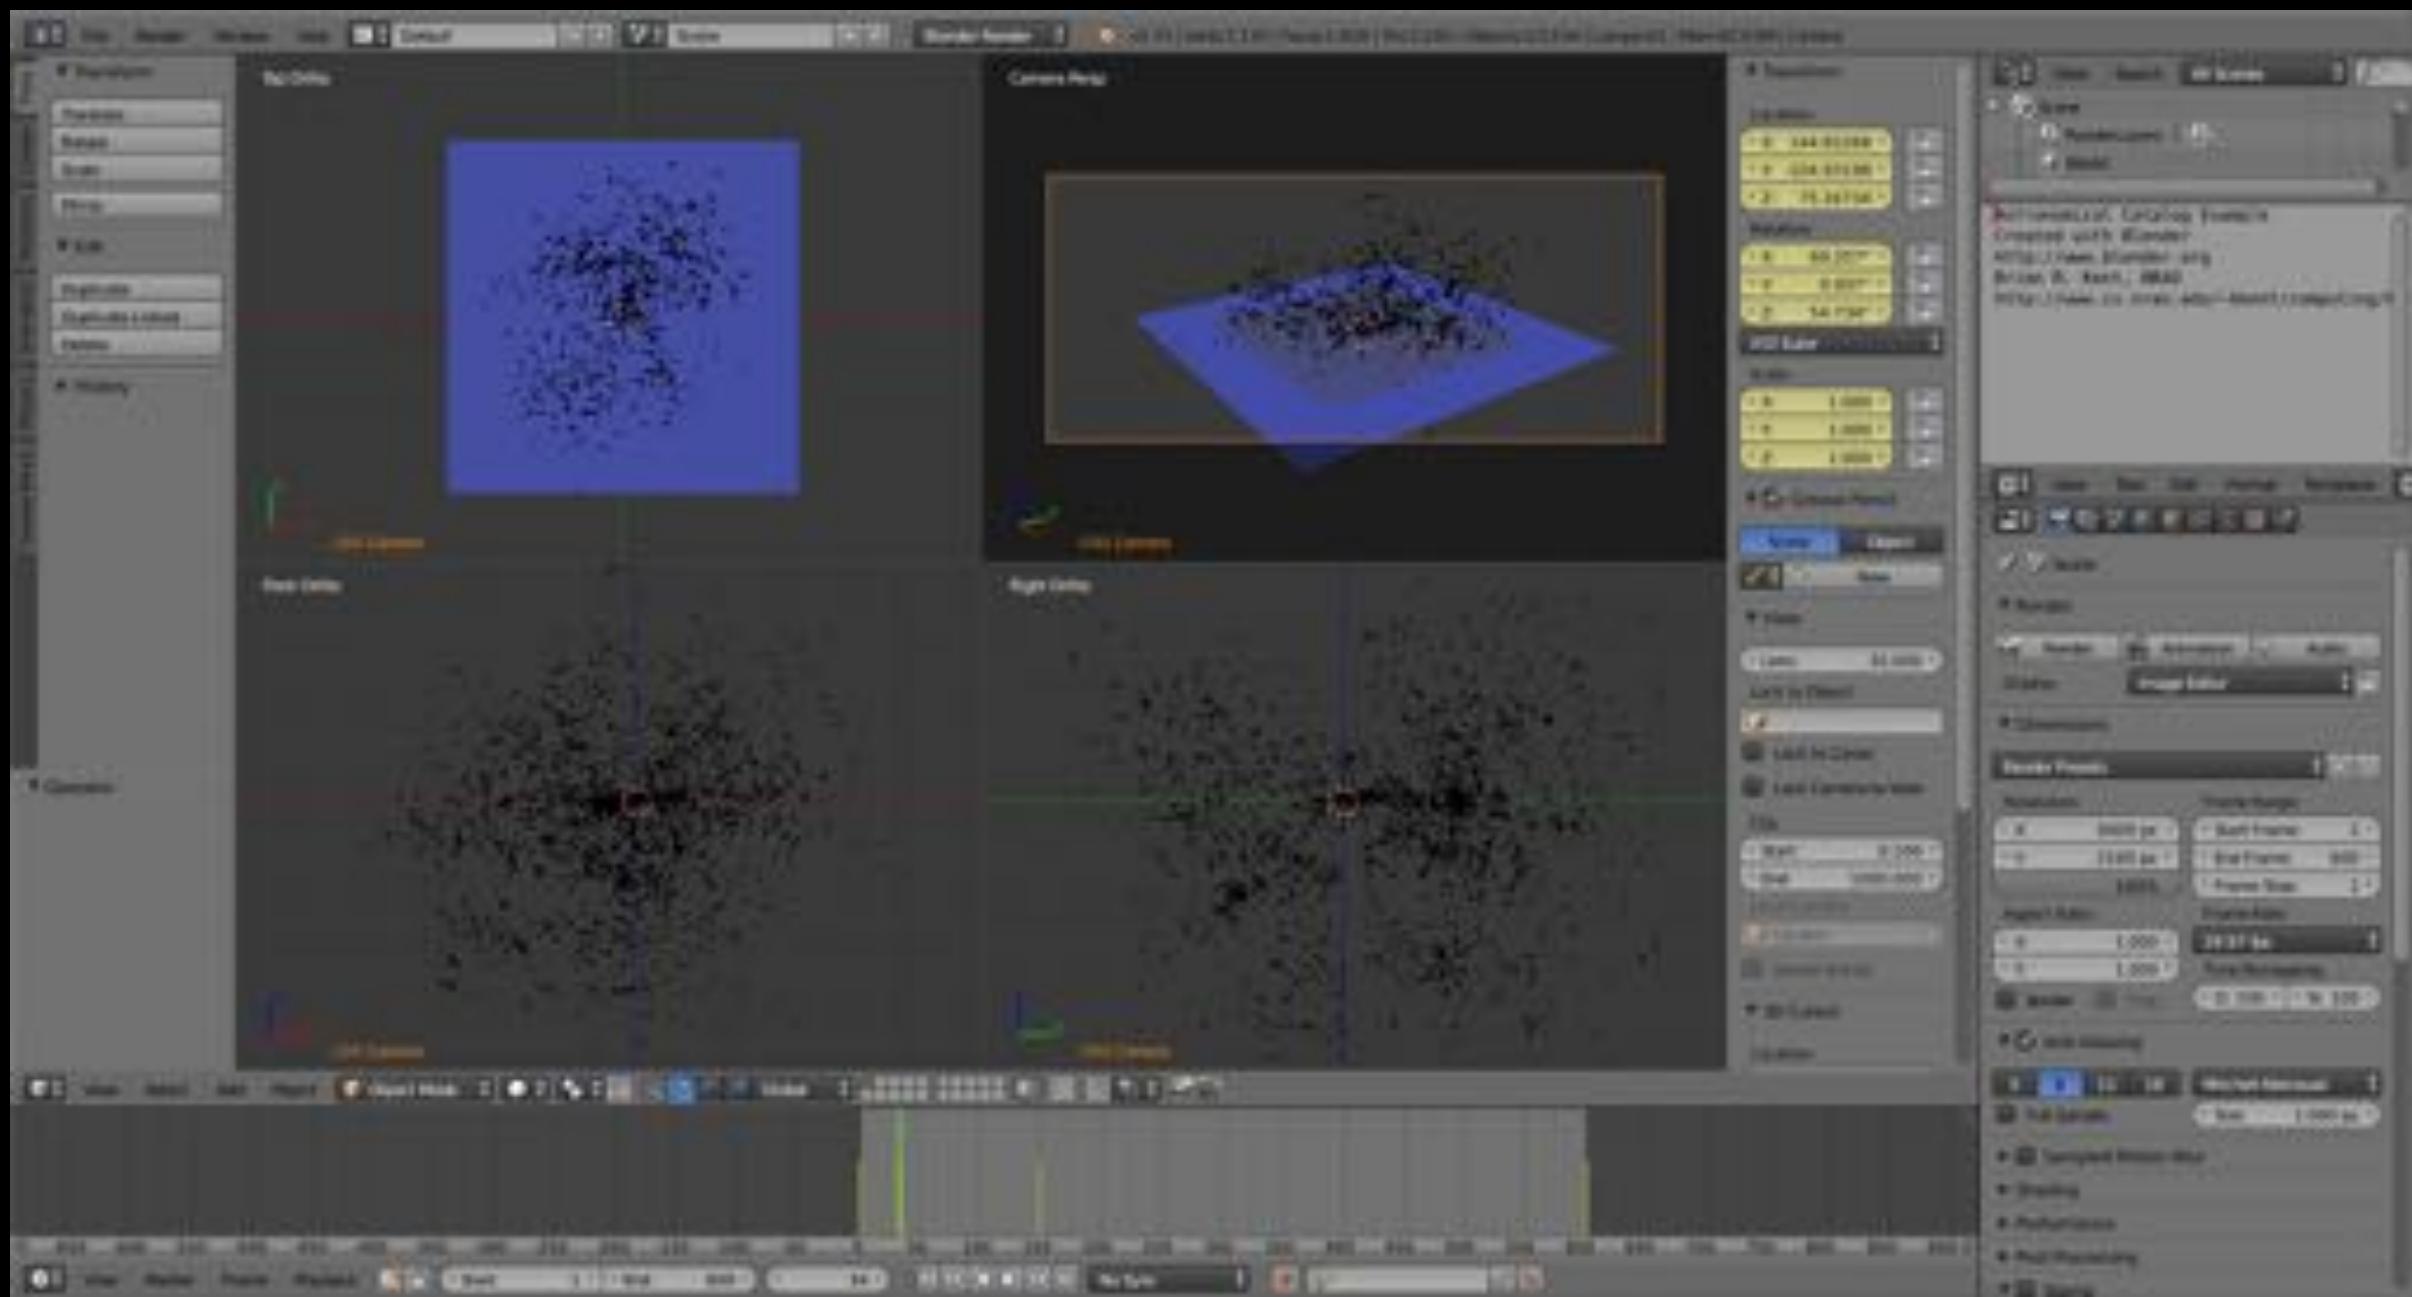

We need to consider:

- Models - physical or data containers?
- Textures - 2D, 3D, and projections?
- Lighting - illumination of data - physical or artistic
- Animation - How will the model move and change?
- Camera control - lens selection, angle, image size, and movement and tracking
- Rendering - backend engine choice
- Compositing - layering final output

# Data Cubes

- Gridded data can come from telescopes or simulations
- Radio telescopes produce grids that cover...
  - Two sky coordinates (RA and Decl.)
  - Frequency (Z - the doppler shifted velocity)
- These cubes can show the dynamics of galaxies, planetary disks, and large scale structure formation of clusters
- HCN Comet Lemmon – Cordiner et al...

<https://www.youtube.com/watch?v=RDUVZ9MIW2I>

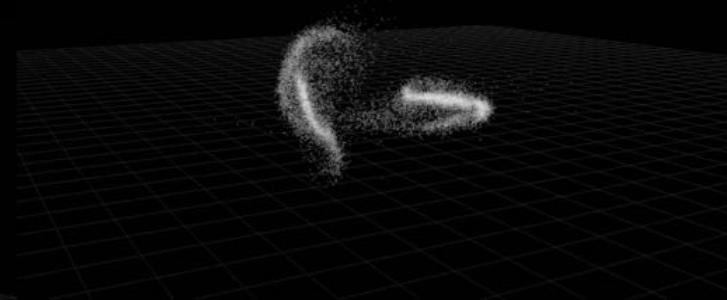

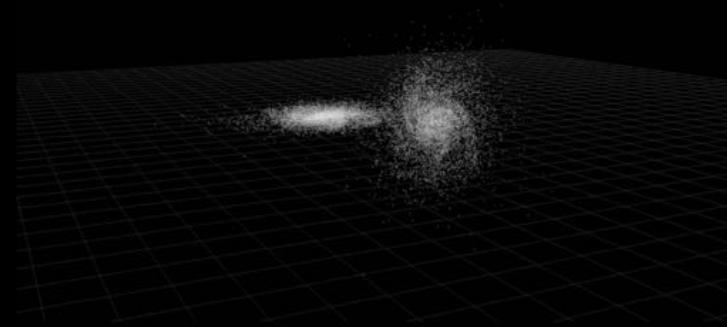

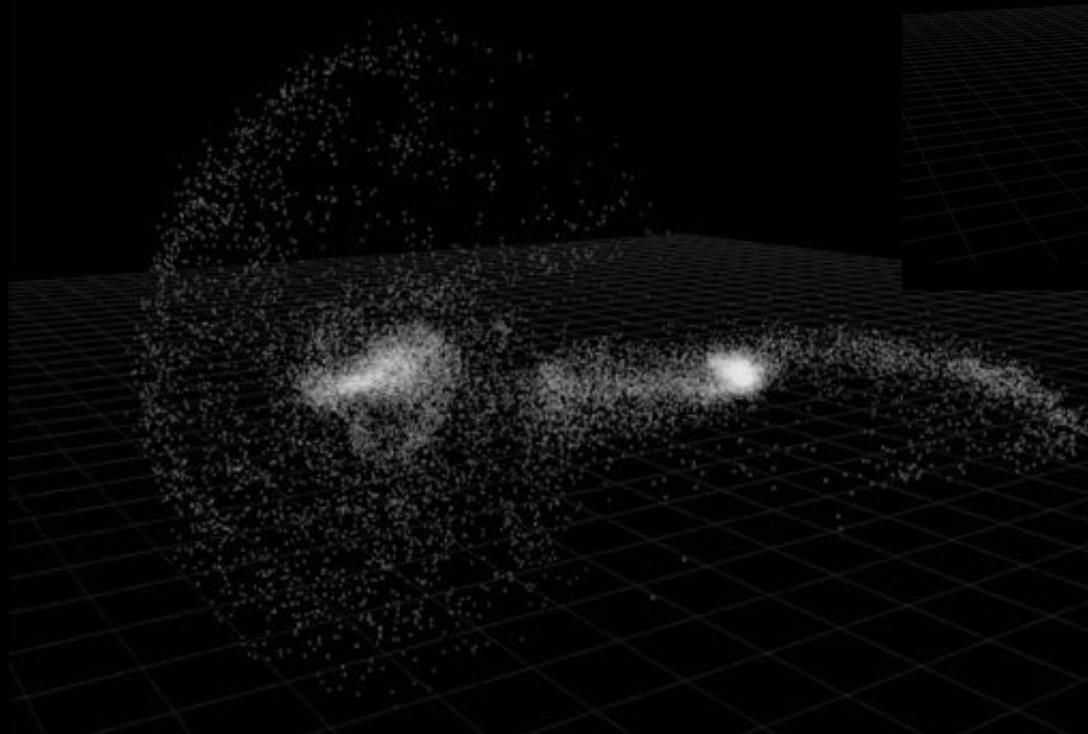

# Data Cubes

- Density maps of the nearby Universe can be created on regularly spaced grids.
- The results of these surveys allow to study not only the density of galaxies in 3D, but also the effects of gravity in the same regions of space...
- PSCz redshift catalog... (Saunders et al. 2000)

[https://www.youtube.com/watch?v=3cuNT8\\_YEF0&t=2s](https://www.youtube.com/watch?v=3cuNT8_YEF0&t=2s)

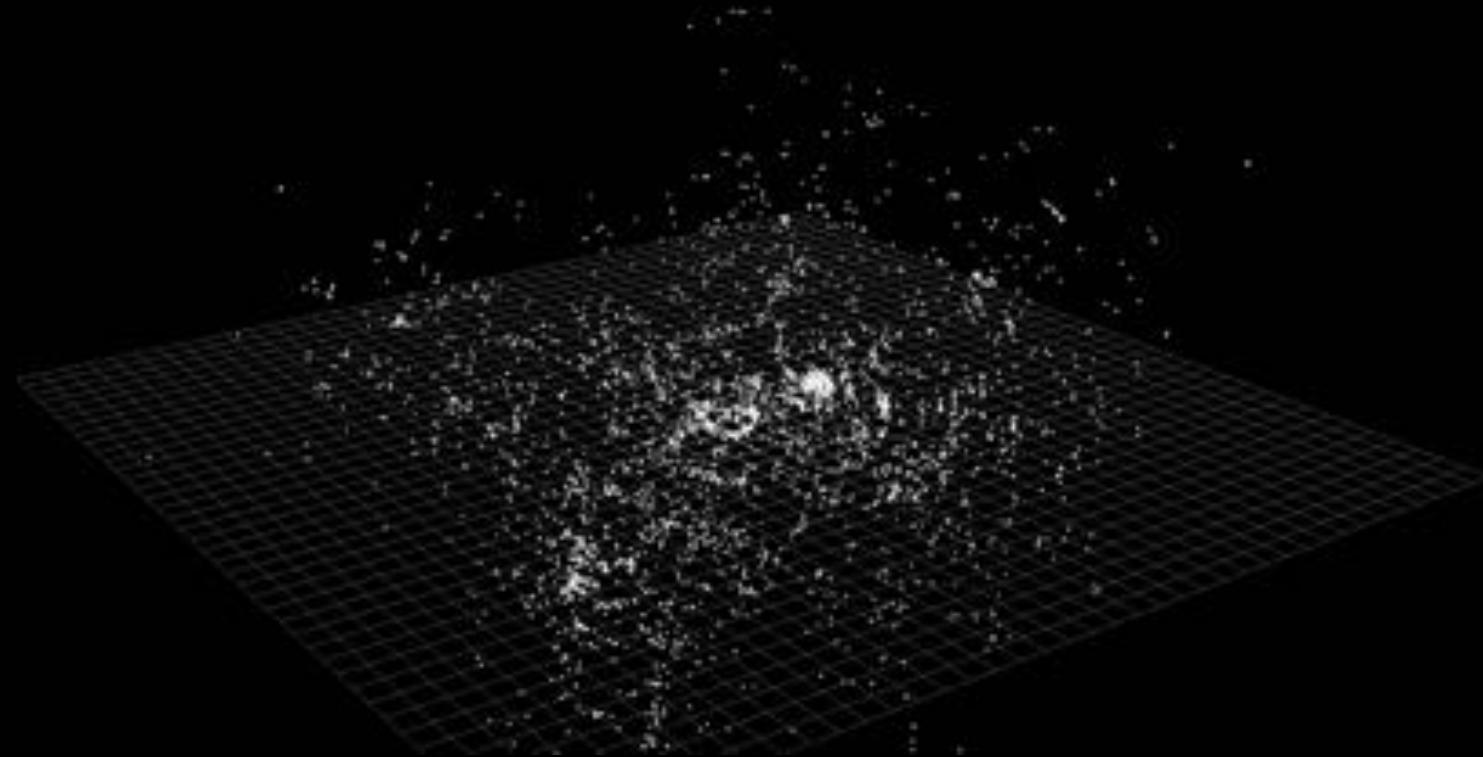

# N-body Simulations

- Data generated from GADGET-2 (Galaxies and Dark Matter Interacting 2) N-body/SPH code
  - <http://www.mpa-garching.mpg.de/gadget/>
- 30,000 particles, 1100 snapshots run for 2 billion years
- Blender Python interface used to bring XYZ position data into the vertices of Blender objects
- Objects are “textured” with Halos.
- Each grid square is approximately 33,000 light years

Gárate

**Figure 4.** Protoplanetary disk with a massive planet carving a gap (S. Perez et al. 2017, in preparation). Simulation data provided by S.Perez using FARGO3D. The output was converted from an spherical grid as described in the Section 3.1. The image was post-processed to brighten the colors, and the halo points were added to emulate surrounding stars.  
(A color version of this figure is available in the online journal.)

**Figure 5.** Stellar winds from a Wolf-Rayet star moving through the galactic center (Cudra et al. 2008). Simulation data provided by J. Cudra. The output was converted from an SPH simulation as described in Section 3.2. The image was post-processed to brighten the colors, and also the Blend Sky option of the World properties was used to add the background colors.  
(A color version of this figure is available in the online journal.)
