The TESS Mission

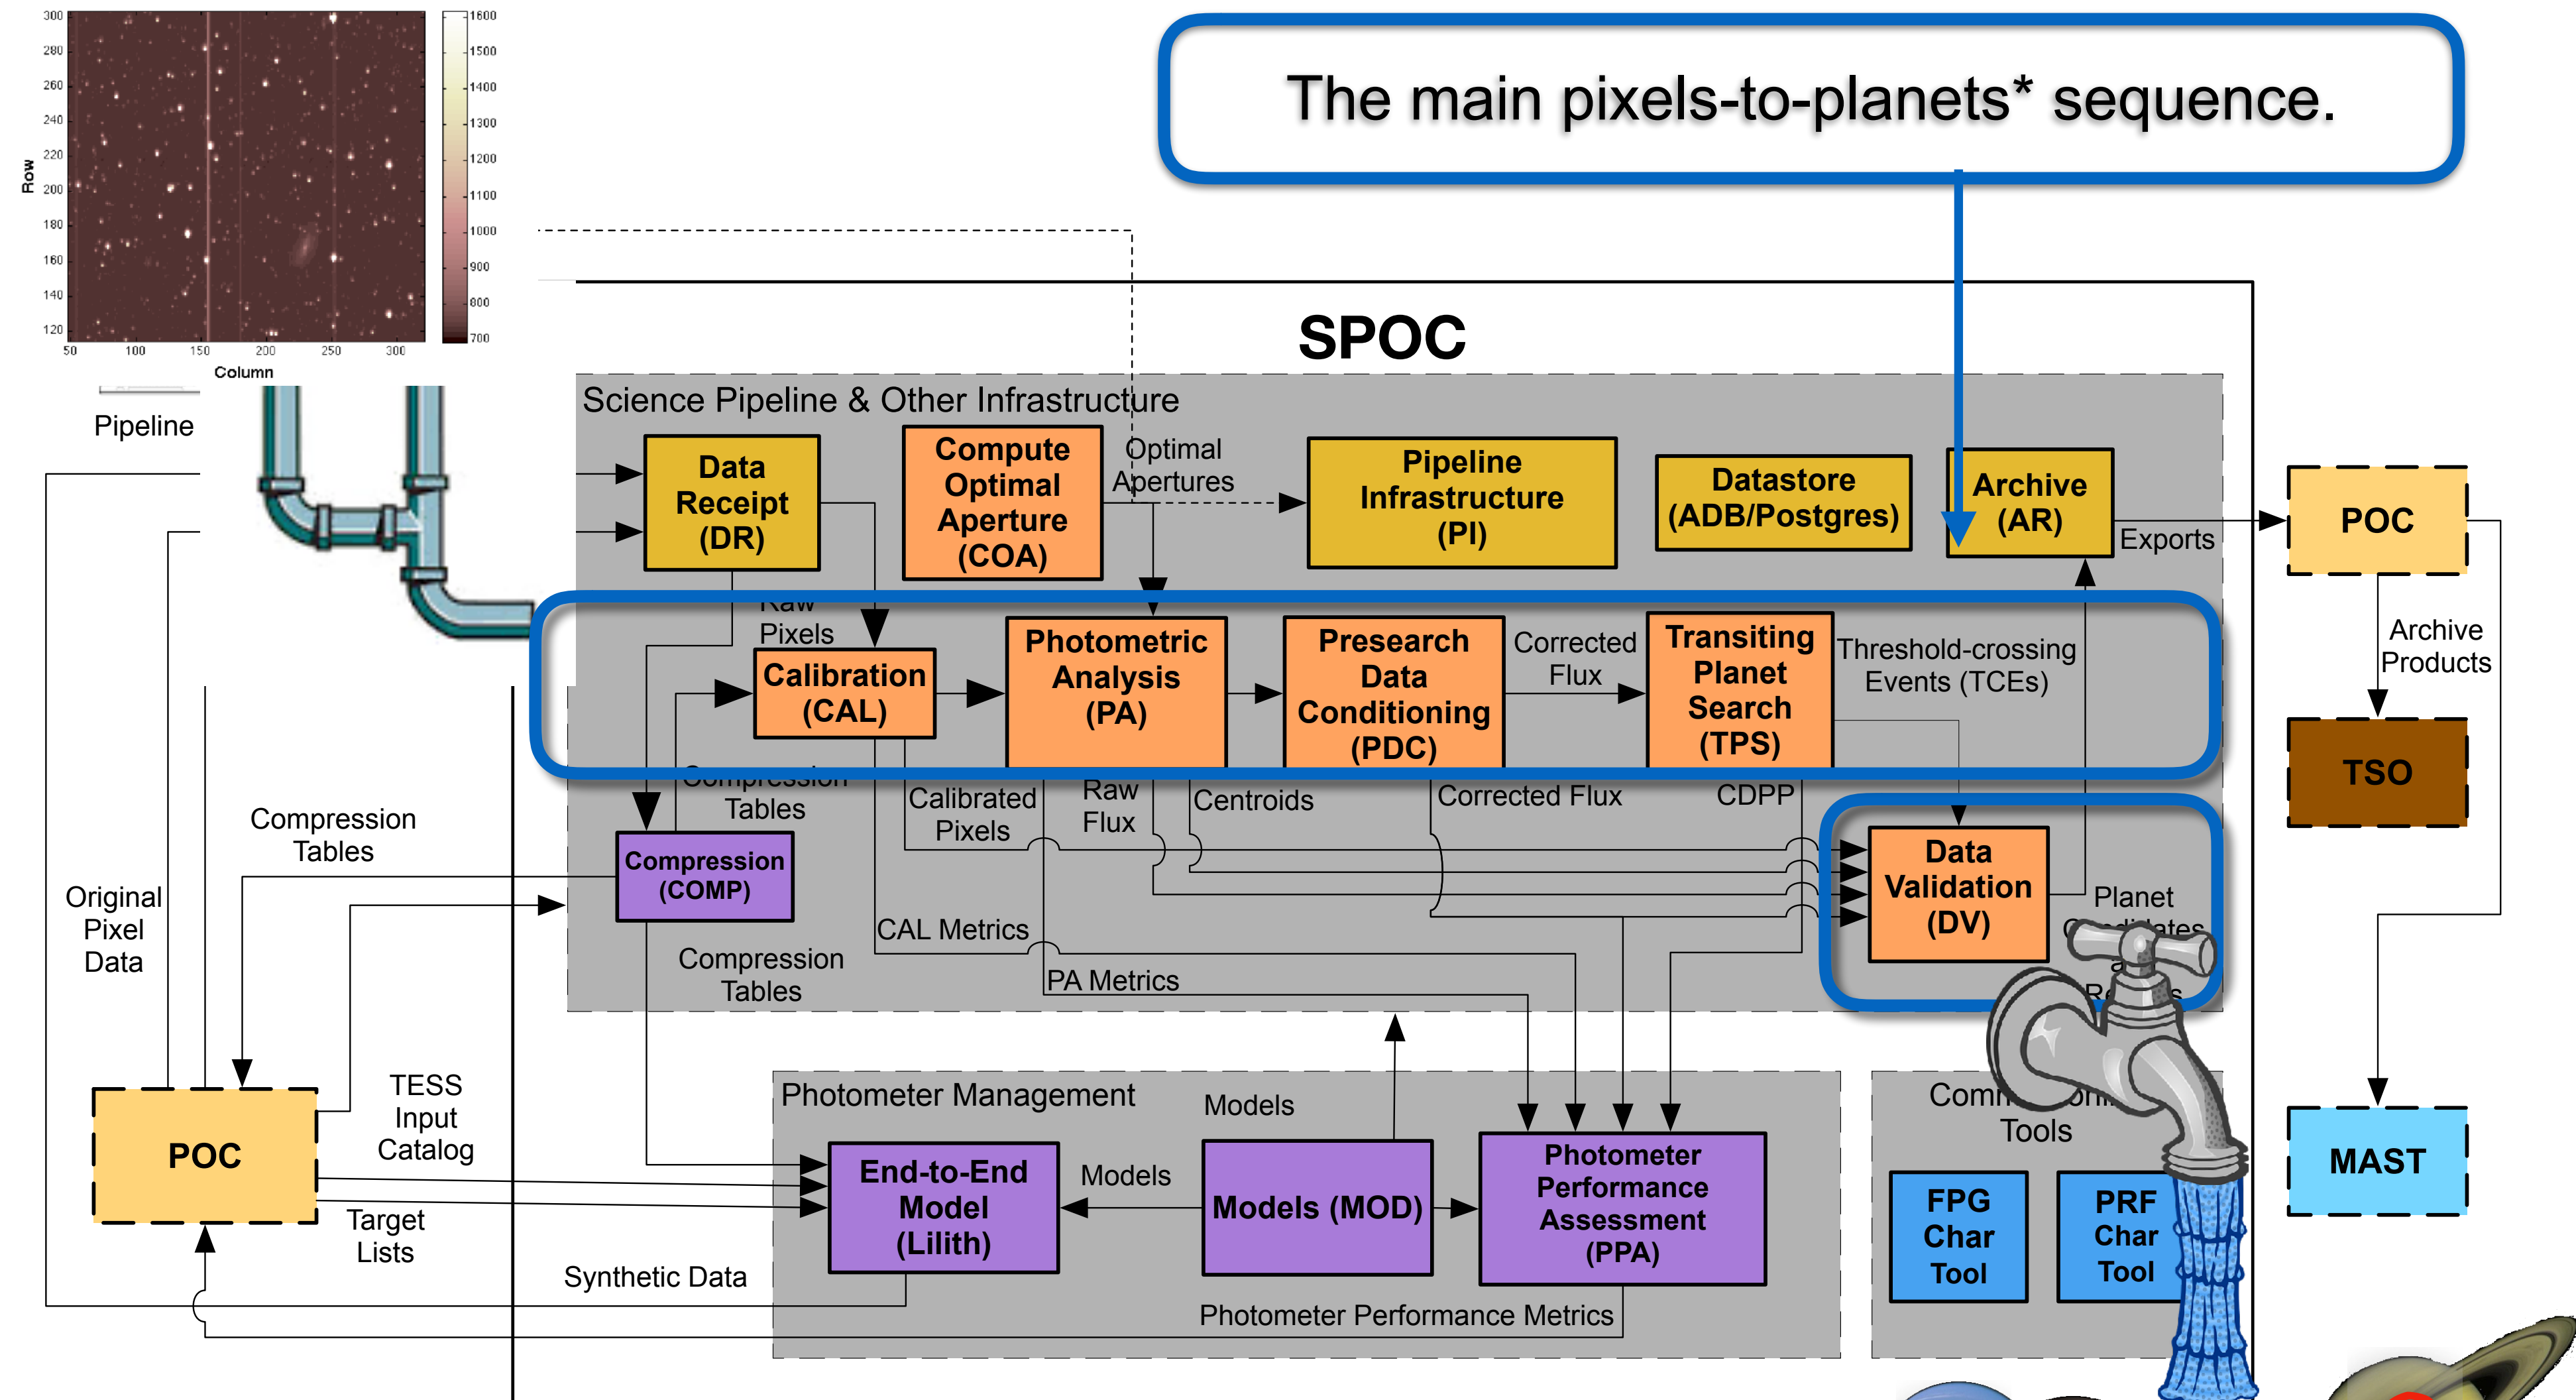

The image shows the Transiting Exoplanet Survey Satellite (TESS) in space. The satellite has a central body with gold-colored insulation, two large blue solar panel arrays, and a large gold-colored sunshield. It is positioned against a black background filled with stars. In the bottom right corner, a bright yellow star is visible with several small black dots representing transiting exoplanets.

The TESS Mission

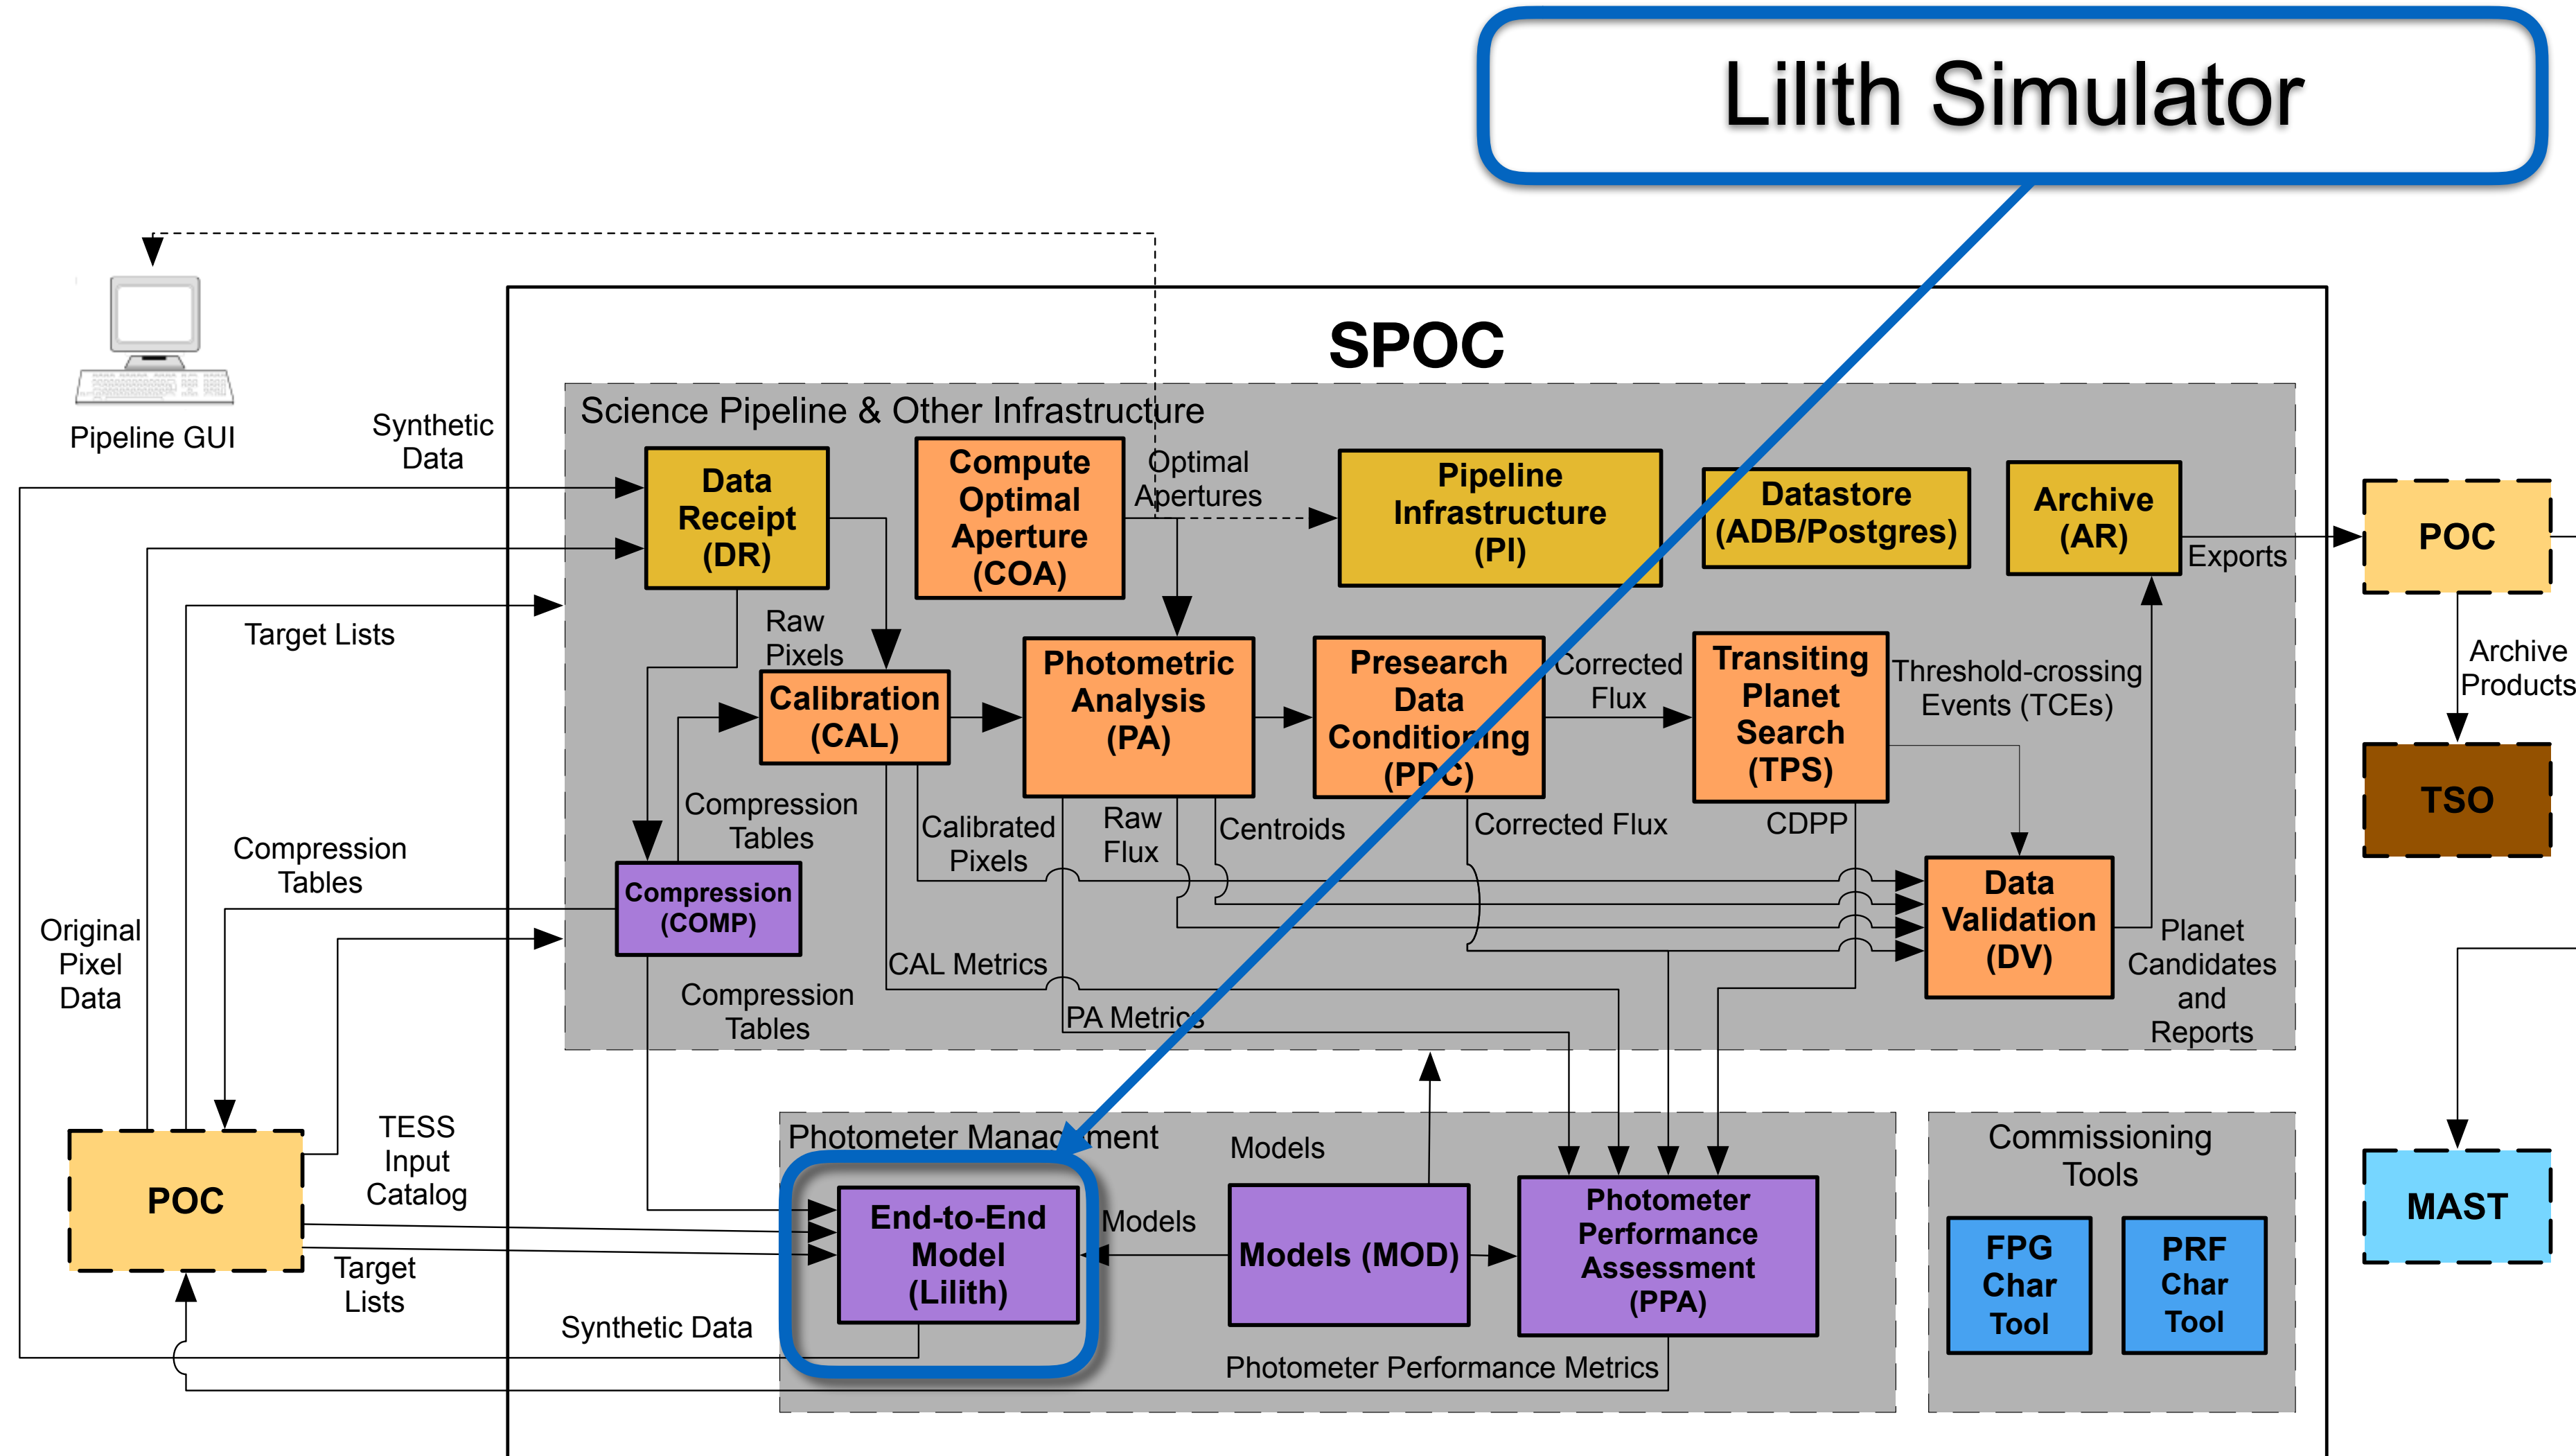

Not the topic of this talk!

* Potential planets, Lots of follow-up analysis to confirm the planets!

- Incorporates ***Instrumental*** models for:
 - CCD layout and geometry
 - readout electronics, read/shot/gain/linearity etc...
 - camera optics / focus changes
 - behavior of the attitude control system (ACS)
 - spacecraft jitter
 - spacecraft orbit and DVA
 - thermal effects (Solar motion, Data downlinks and thermal recoveries, etc...)
- Also incorporates ***Astrophysical*** models for:
 - Zodiacal light
 - TESS Input Catalog
 - stellar variability (based on PSD analysis of Kepler light curves)
 - eclipsing binaries (based on Kepler EB distributions)
 - background eclipsing binaries (randomly placed and not on known TIC objects)
 - Other background stellar objects
 - transiting planets (limb darkened transit model)
 - Target “Postage Stamp” modeling
 - Entire CCD scene

- Incorporates ***Instrumental*** models for:
 - CCD layout and geometry Focal Plane Geometry
 - readout electronics, read/shot/gain/linearity etc... Flux levels, Pixel Calibrations
 - camera optics / focus changes Pixel Response Function
 - behavior of the attitude control system (ACS) Motion Polynomials
 - spacecraft jitter Noise Isolation and Removal
 - spacecraft orbit and DVA Flux Drift
 - thermal effects (Solar motion, Data downlinks and thermal recoveries, etc...) Systematic Error Removal
- Also incorporates ***Astrophysical*** models for:
 - Zodiacal light Background subtraction
 - TESS Input Catalog Data Validation, Planet Characterization
 - stellar variability (based on PSD analysis of Kepler light curves) Stellar Signal Characterization
 - eclipsing binaries (based on Kepler EB distributions) False Positive Vetos
 - background eclipsing binaries (randomly placed and not on known TIC objects)
 - Other background stellar objects Image Crowding
 - transiting planets (limb darkened transit model) **Transit Detection**
 - Target “Postage Stamp” modeling Simple Aperture Photometry
 - Entire CCD scene Full Frame Images

- Incorporates **Instrumental** models for:

– CCD layout and geometry
 – readout electronics, read/shot/gain/linearity etc...
 – camera optics / focus changes
 – behavior of the attitude control system (ACS)
 – spacecraft jitter
 – spacecraft orbit and DVA
 – thermal effects (Solar motion, Data downlinks and thermal recoveries, etc...)

Focal Plane Geometry
 Flux levels, Pixel Calibrations
 Pixel Response Function
 Motion Polynomials
 Noise Isolation and Removal
 Flux Drift
 Systematic Error Removal

- Also incorporates **Astrophysical** models for:

– Zodiacal light
 – TESS Input Catalog
 – stellar variability (based on PSD analysis of Kepler light curves)
 – eclipsing binaries (based on Kepler EB distributions)
 – background eclipsing binaries (randomly placed and not on known TIC objects)
 – Other background stellar objects
 – transiting planets (limb darkened transit model)
 – Target “Postage Stamp” modeling
 – Entire CCD scene

Background subtraction
 Data Validation, Planet Characterization
 Stellar Signal Characterization
 False Positive Vetos
 Image Crowding
 Simple Aperture Photometry
 Full Frame Images

Transit Detection

- Focal Plane Geometry (FPG) Model characterizes the mapping of stellar coordinates to pixel location
 - RA/Decl. => Pixels
 - Has to account for all optical perturbations of the image.
 - Critical for target selection and aperture photometry.

Worked Beautifully!

FPG fits out
simulated perturbations
in model

Fit to real data
Not so good!

1D plateScale1 MP1-5; Fitted Error [Pixels] on reference cadence

Fit to real data
Not so good!

????

1D plateScale1 MP1-5; Fitted Error [Pixels] on reference cadence

????

Fit to real data
Not so good!

????

1D plateScale1 MP1-5; Fitted Error [Pixels] on reference cadence

????

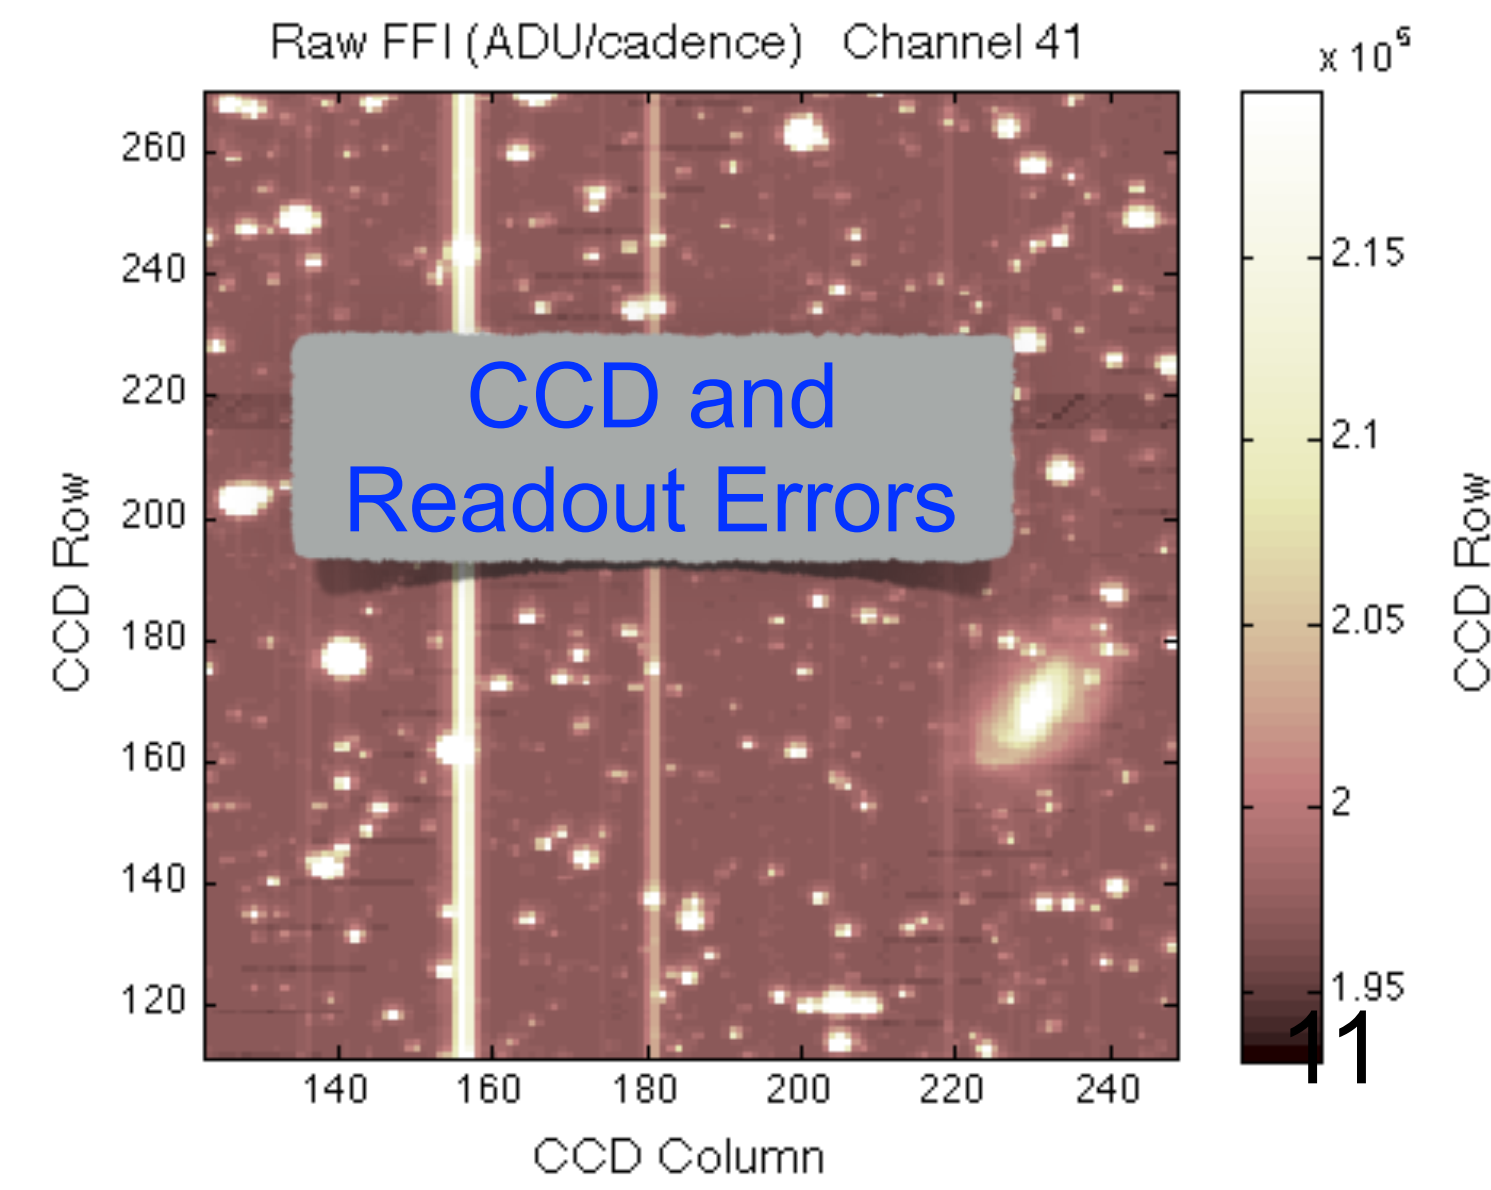

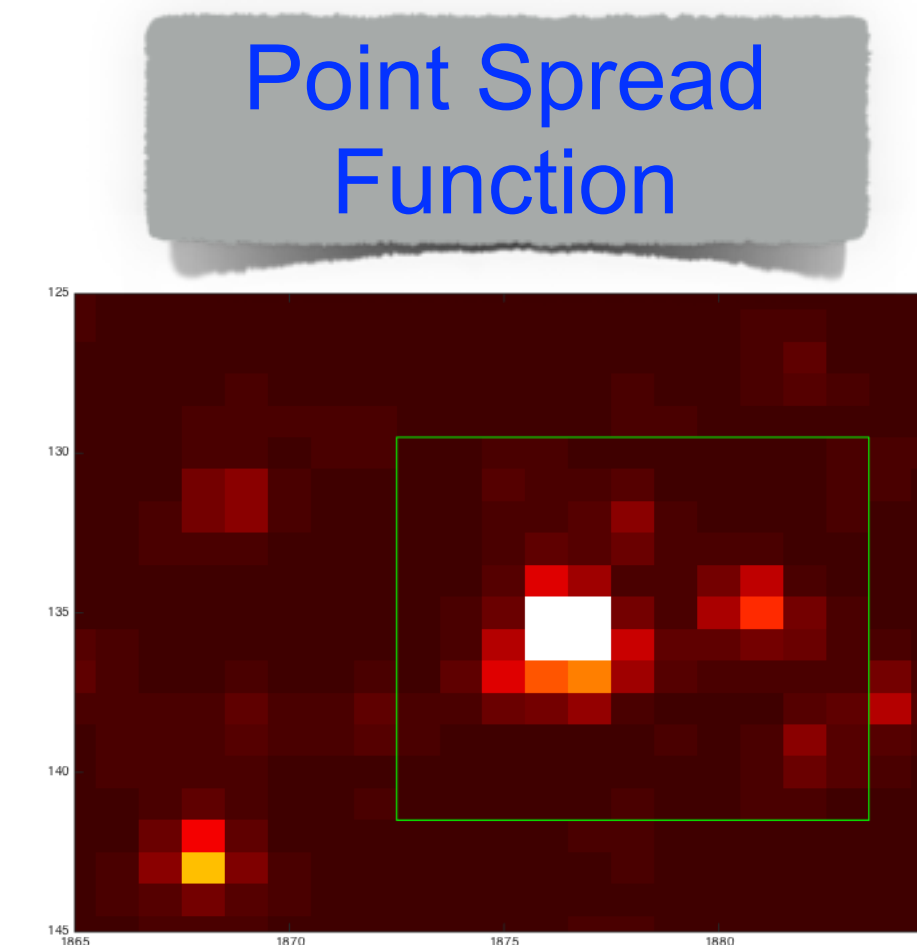

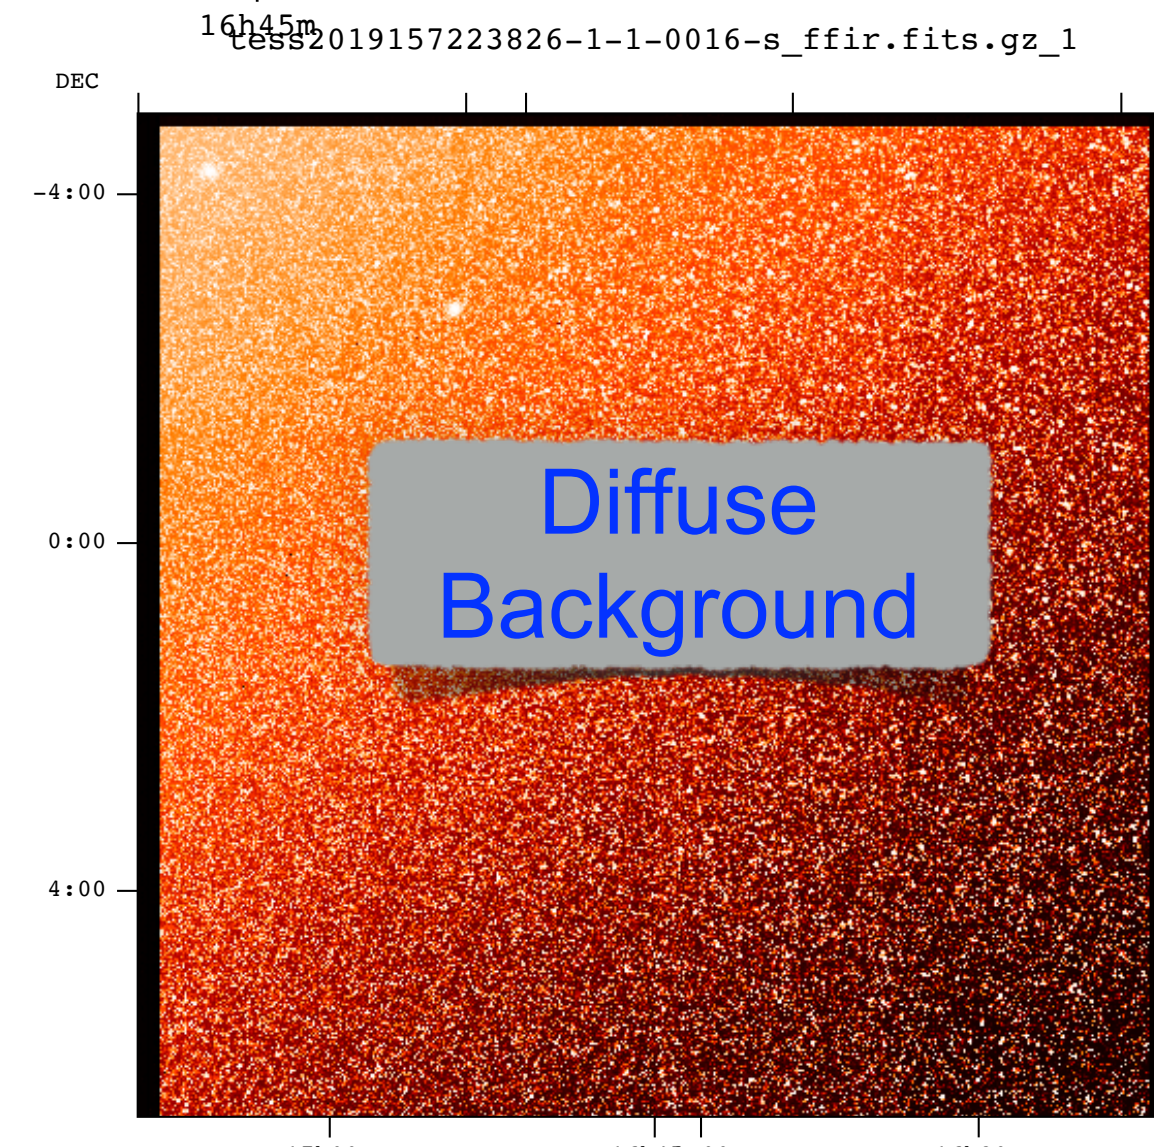

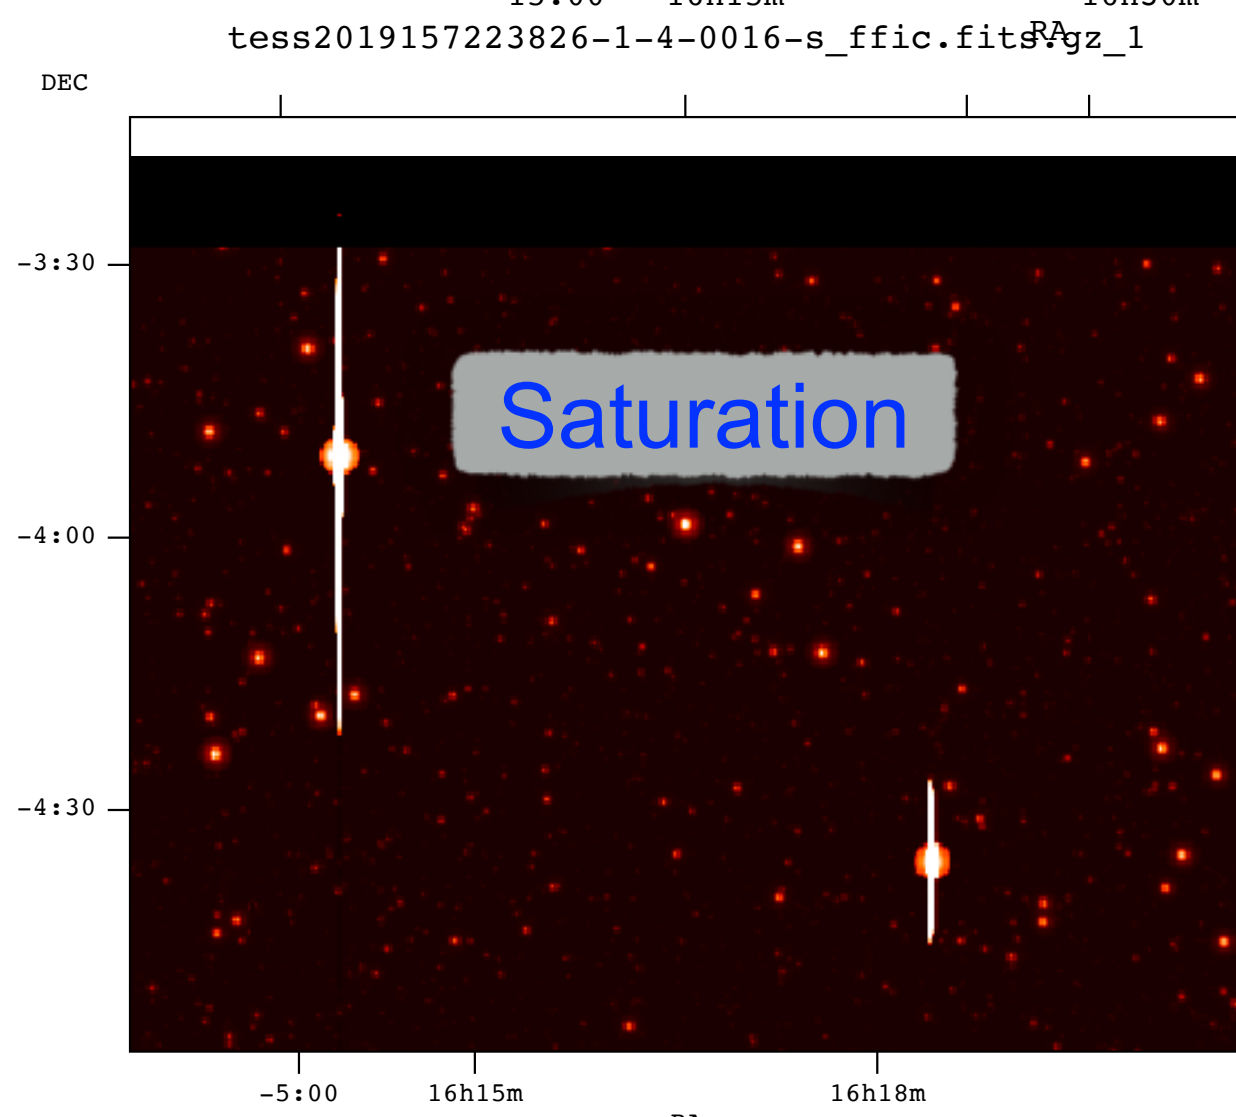

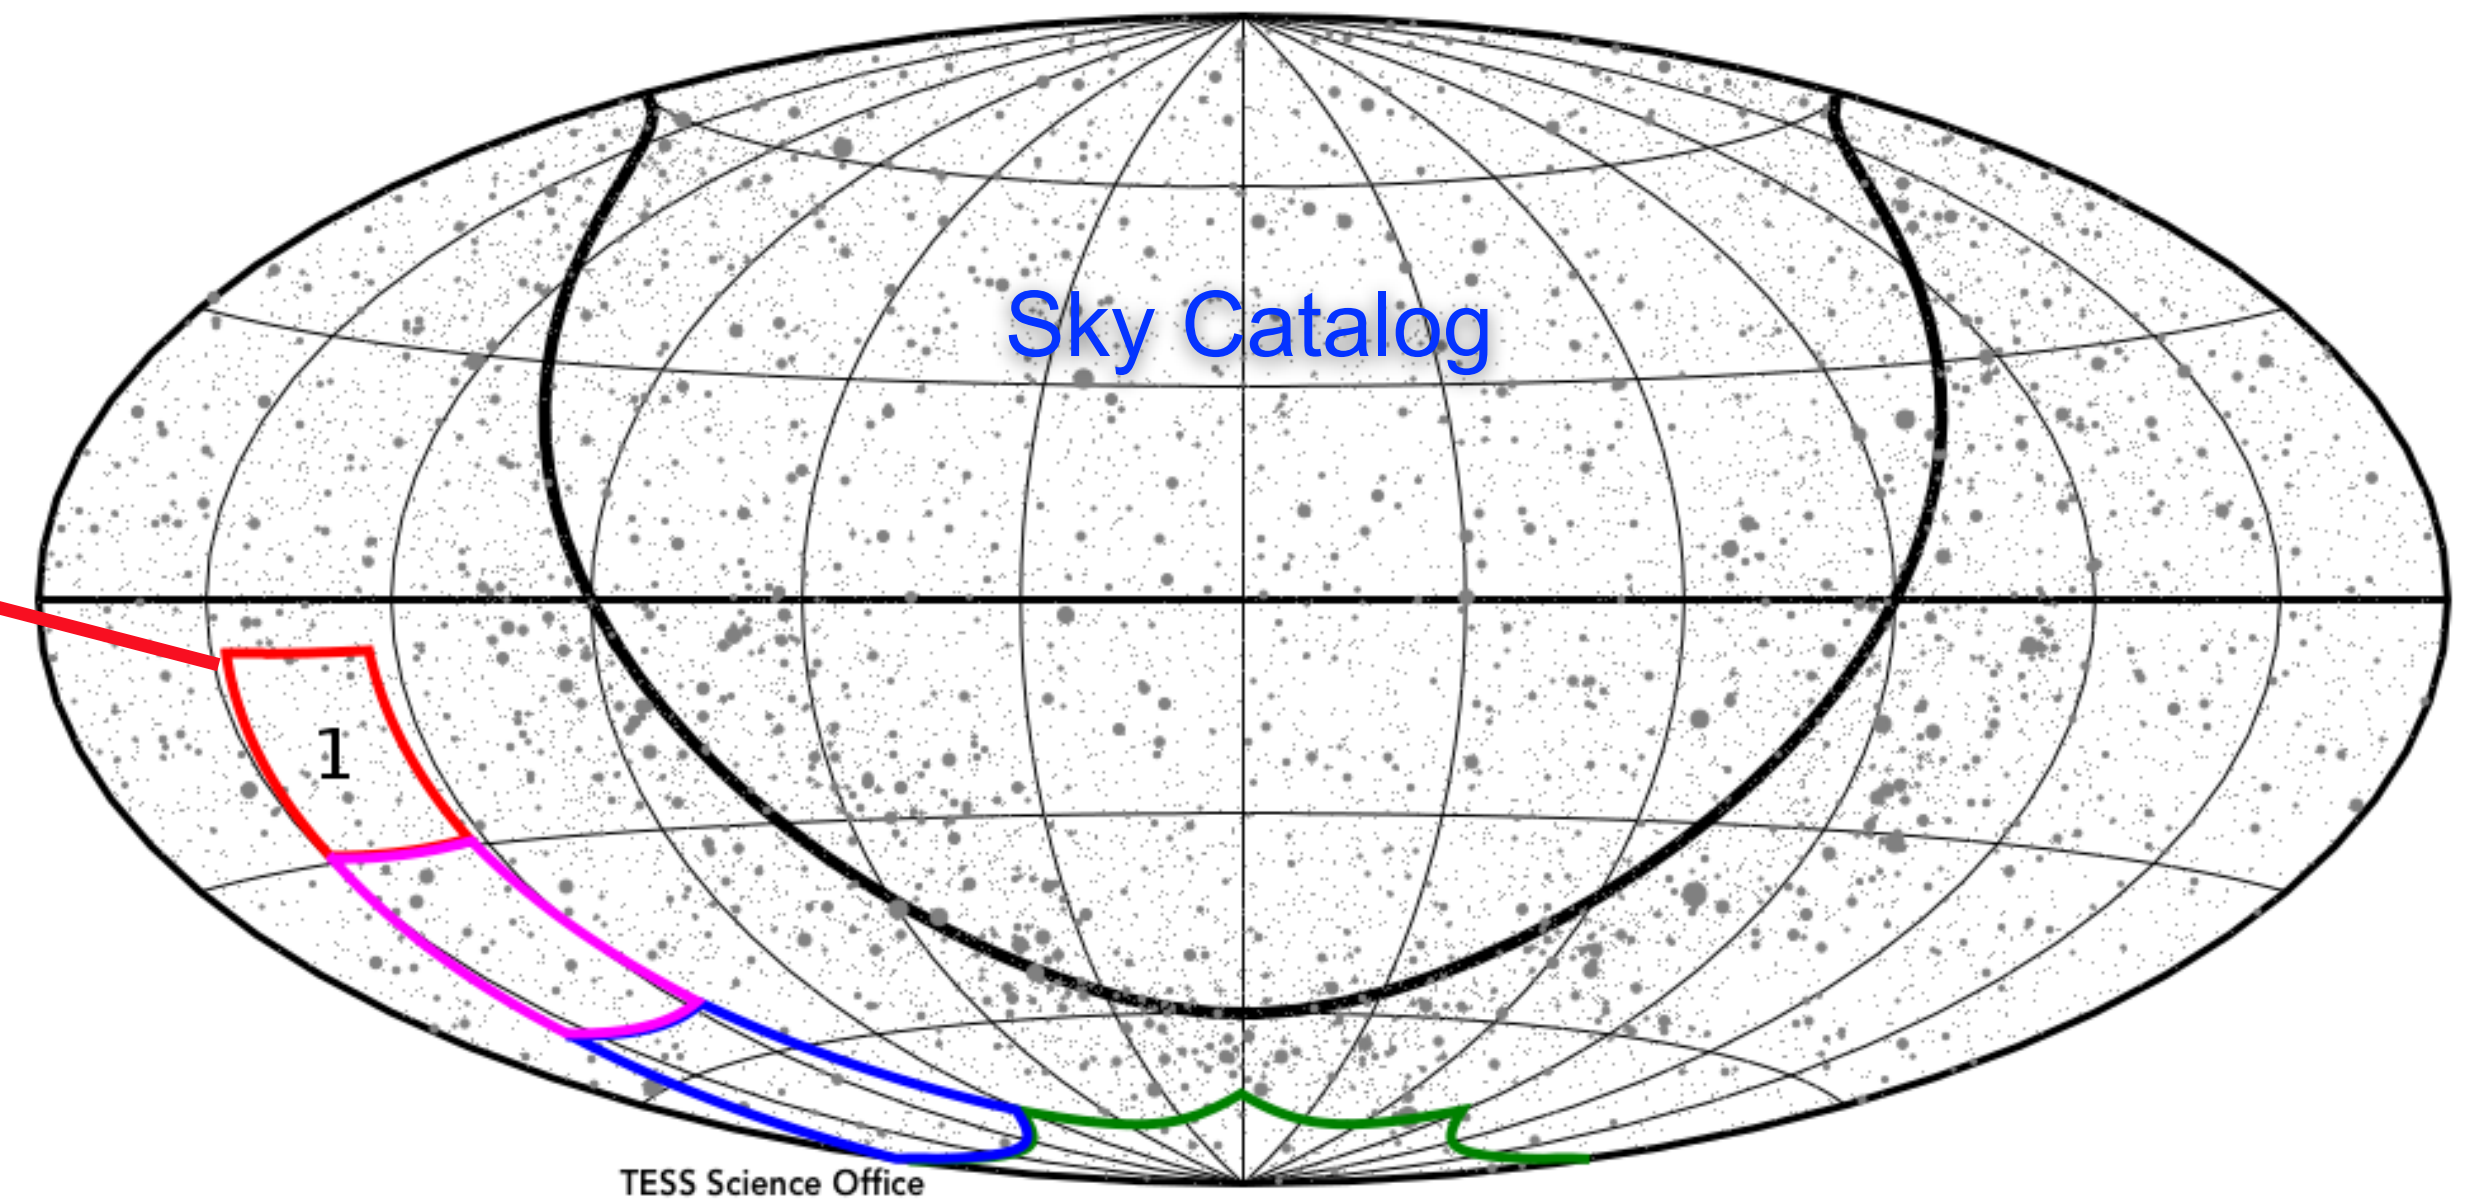

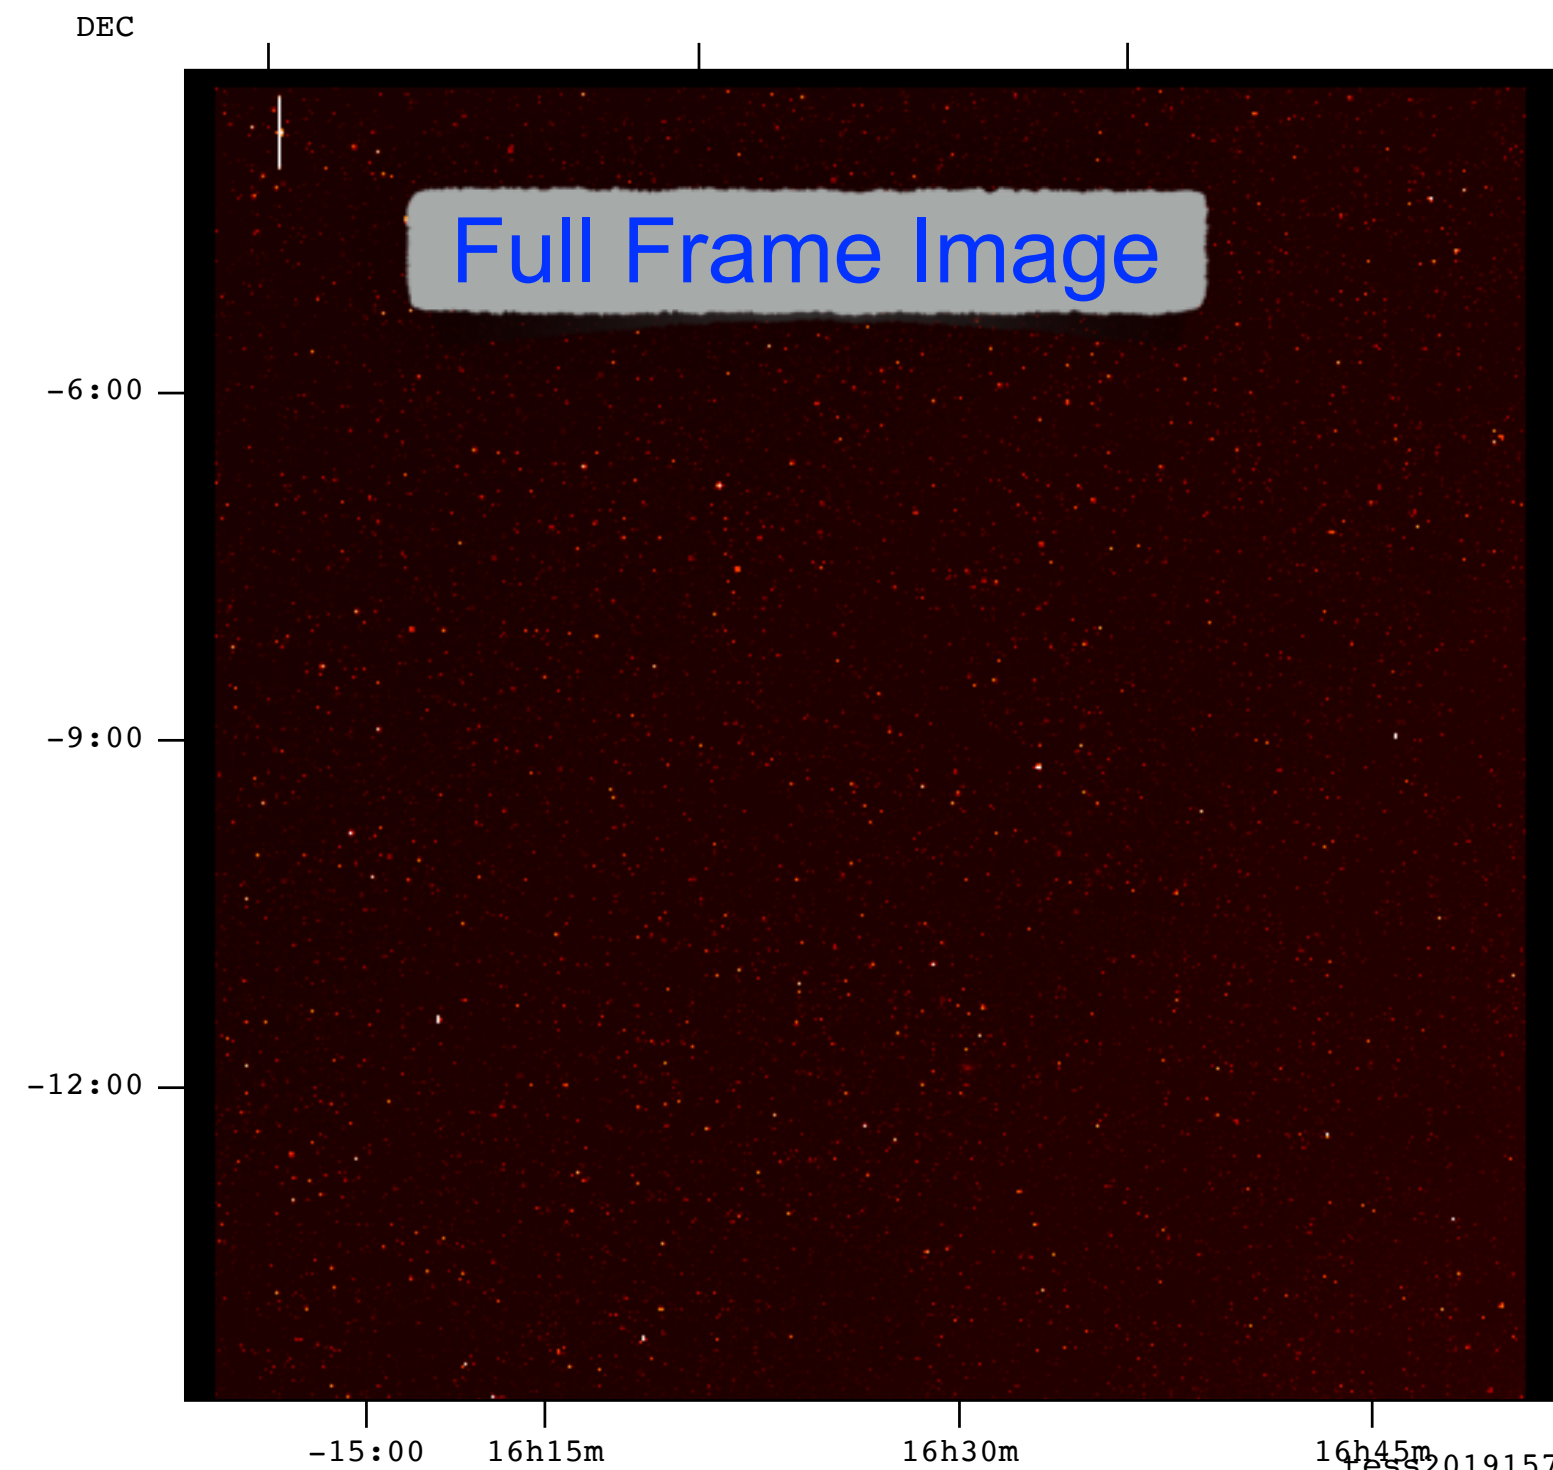

New 2D geometryModel; MP1-5; Fitted Error [Pixels] on reference cadence

Needed more
generalized FPG
model to account for all
real-world perturbations

This Data Validation Report Summary was produced in the TESS Science Processing Operations Center Pipeline at NASA Ames Research Center

Preliminary: Using a not-well tuned classifier!

- See Megan Ansdell talk from two days ago for an application of this data.

- **Raw pixel data passed through the SPOC pipeline just like any real flight data**
 - Continue to provide simulated data set with updated astrophysics and instrumental models.
 - *Provide fully simulated data with ground-truth that parallels real flight data to assist researchers in adapting their tools to the TESS data set.*
 - *How well do **your** signals behave in our data processing pipeline?*

Thank you!

MAST TESS data archive:

<https://archive.stsci.edu/tess/index.html>

- Named by someone who *hates* acronyms!
- Name comes from the song “Lilith/Eve” by industrial rock band *Machines of Loving Grace*, due to the first lines of that song: “I’m talking darkest night / A shoddy simulation of paradise...”.
- This wasn’t me! I’ve never even heard of this band!
